Calculator Exercise

- Split into teams of 4, make sure at least one person on each team is a Python novice and one is experienced with Python.

- Distribute the code from from the `calculator-exercise` folder evenly among each of the members.

- One member should create a new GitHub repository for this code, and invite everyone else to join the repository.

Calculator Exercise continued

- The remaining three members should Pull Request their code into the GitHub repository.

- The team should come up with an organization strategy for the files.

- Try to install the software once the repository is organized.
